Visualização de Macromoléculas

Visualização de Macromoléculas

1. **Seleccionar o modelo que se pretende obter (problema biológico)**

2. **Escolher a base de dados de macromoléculas (geralmente o Protein Data Bank, http://www.rcsb.org)**

3. **Escolher o modelo a analizar, de acordo com as suas características (resolução, número de cadeias, completo, incompleto, condições de cristalização, técnica experimental, ligandos, etc…)**

4. **Descarregar o modelo num dos formatos disponíveis (geralmente formato PDB ou mmCIF)**

5. **Examinar a estrutura num programa de visualização molecular (variados programas de acesso livro, p.exp. PyMOL)**

- O desenvolvimento das técnicas de determinação da estrutura molecular levou à acumulação de um número considerável de estruturas de proteínas (~200000)

- A maior parte das estruturas foram determinadas pelos métodos de difracção (cristalografia) de raios X ou então por ressonância magnética nuclear (RMN)

- A principal base de dados de estruturas de macromoléculas é o Protein Databank (PDB) http://www.rcsb.org

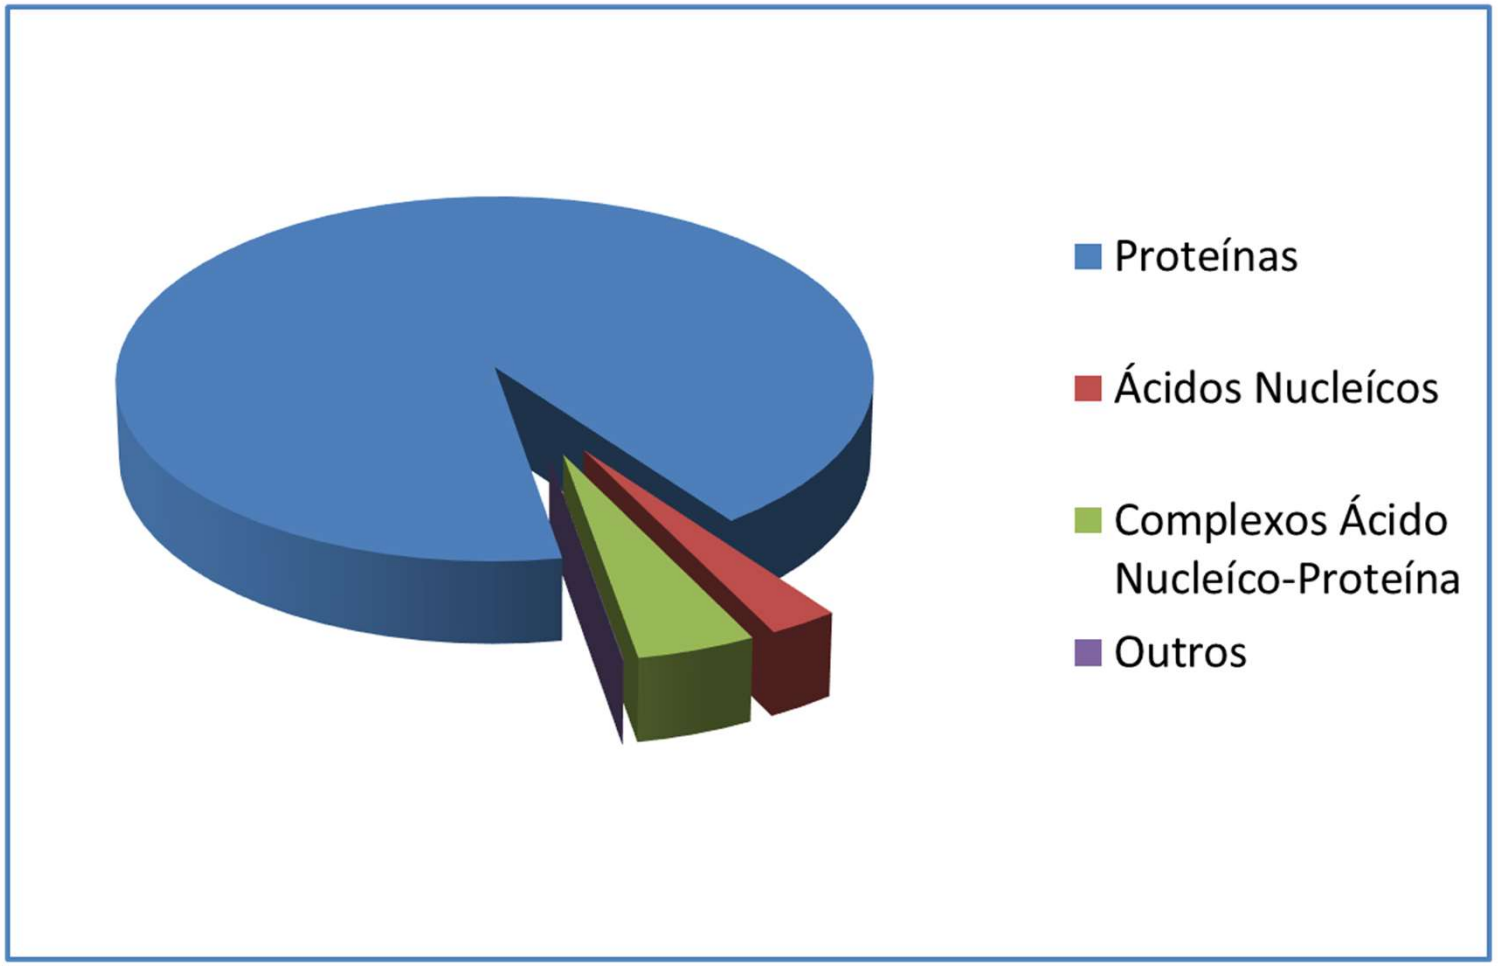
O Protein Data Bank

- O Protein Data Bank (PDB) foi criado em 1971 por E.Meyer e W.Hamilton, do Brookhaven National Laboratory (USA), contendo no início 7 estruturas!
- A gestão do PDB foi transferida em 1998 para os membros do RSCB (Research Collaboratory in Structural Bioinformatics) dos quais a Universidade de Rutgers é o site principal. O PDB (http://www.rcsb.org) é um banco de dados de acesso **livre**.
- Contendo inicialmente estruturas de proteínas, o PDB contem hoje em dia outros tipos de moléculas, tais como ácidos nucleicos, lípidos e polissacáridos.
- Número total de estruturas em 2/3/2021: **174994**

Técnica experimental	Proteínas	Ácidos nucleicos	Complexos Ac.Nuc,/Proteína	Outros	Total
Cristalografia de raios X	144855	2164	7208	160	154387
NMR	11636	1347	260	37	13289
Microscopia electrónica	5342	53	1632	3	7030
Outras	270	10	3	5	288
Total	162103	3574	9112	205	**174994**

Dados de 2/03/2020 em http://www.rcsb.org

O Protein Data Bank contem vários tipos de macromoléculas

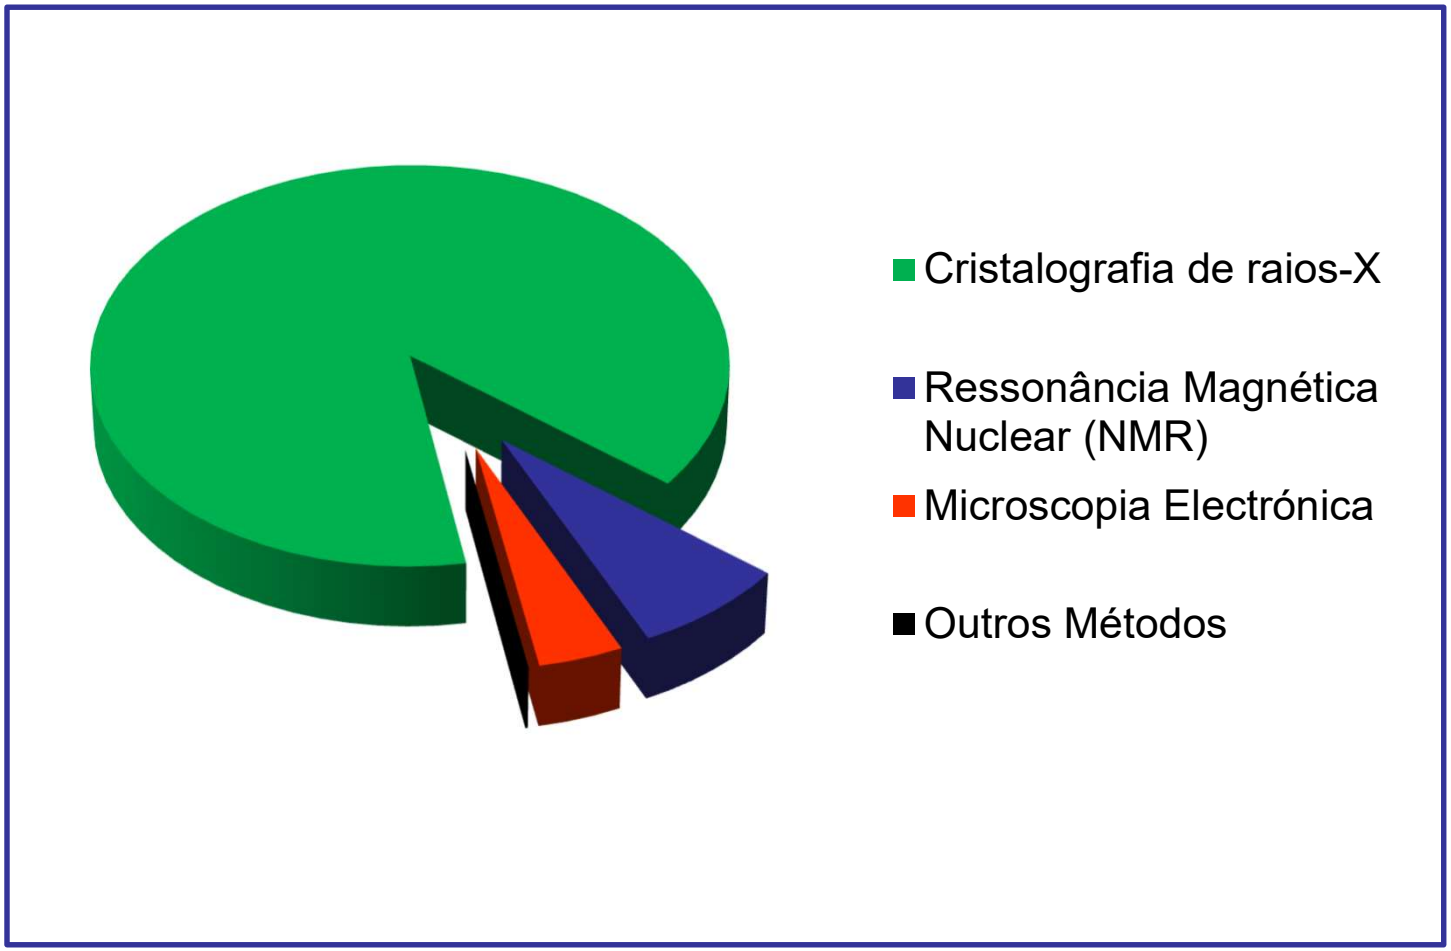


De onde provêm a informação estrutural ?

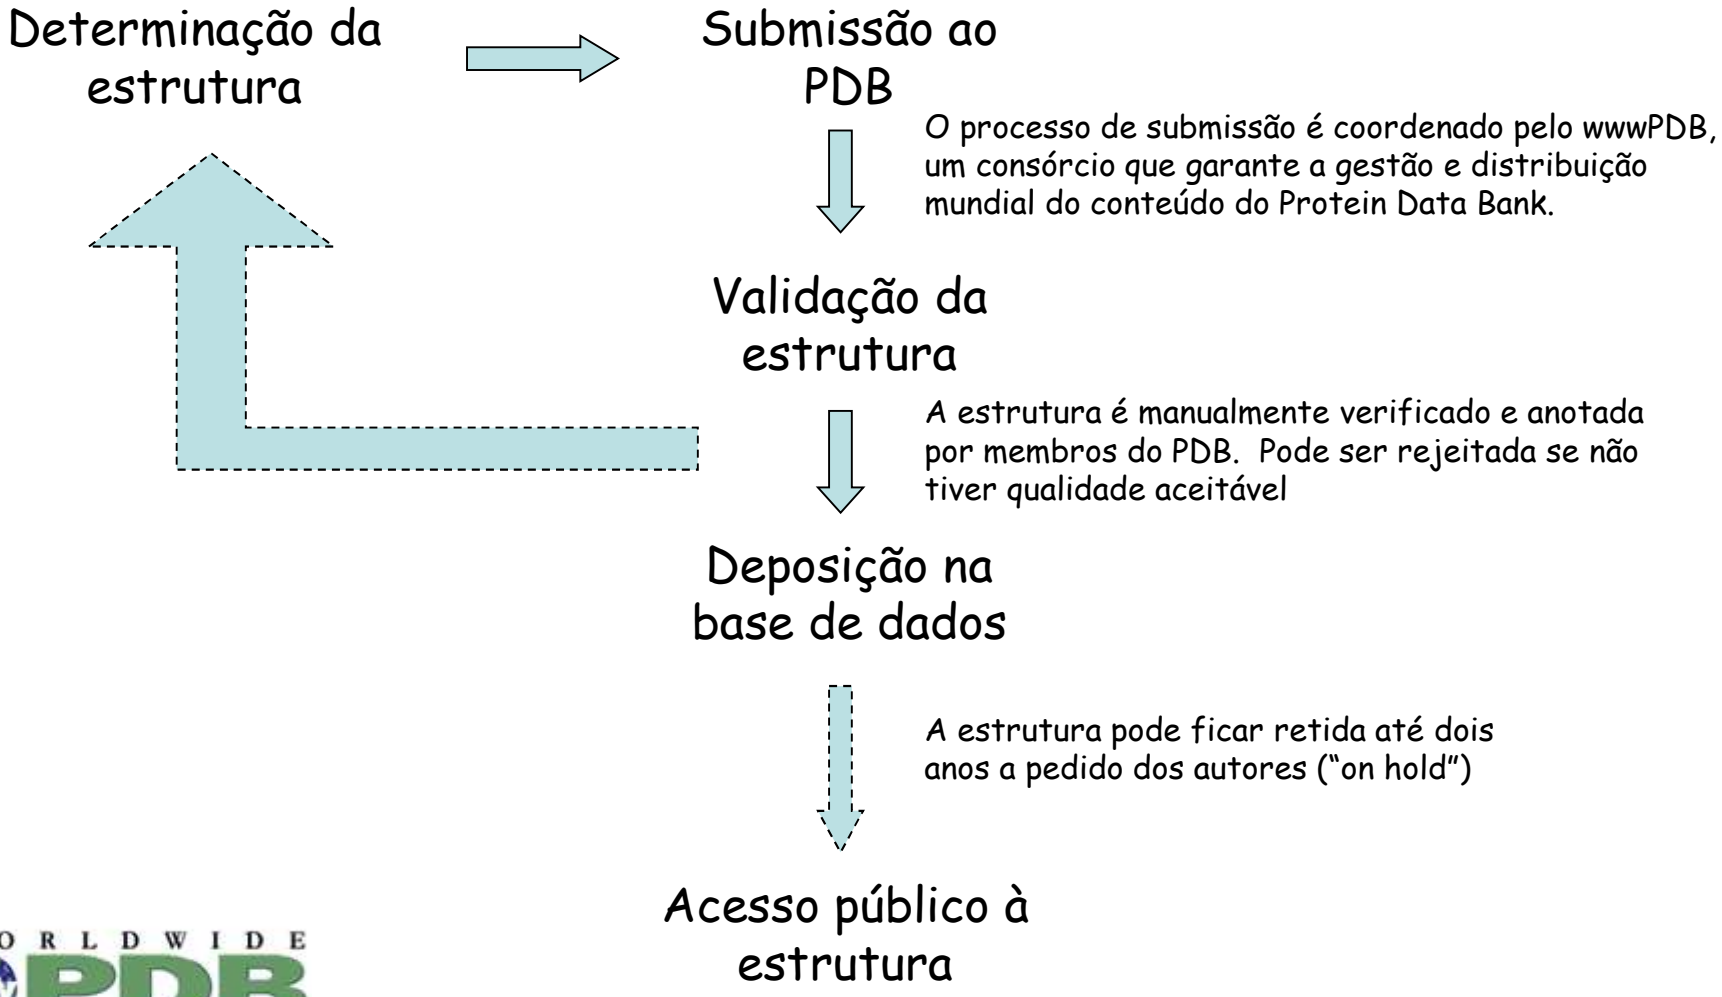
Combinação de vários tipos de conhecimento:

- Teoria da ligação química
- Geometria de moléculas pequenas
- Métodos experimentais para a determinação da estrutura:
  - Cristalografia de raios X
  - Ressonância Magnética Nuclear (NMR)
  - Outros métodos (microscopia, difracção de neutrões, etc…)

A maioria da estruturas do PDB são obtidas por cristalografia de raios X

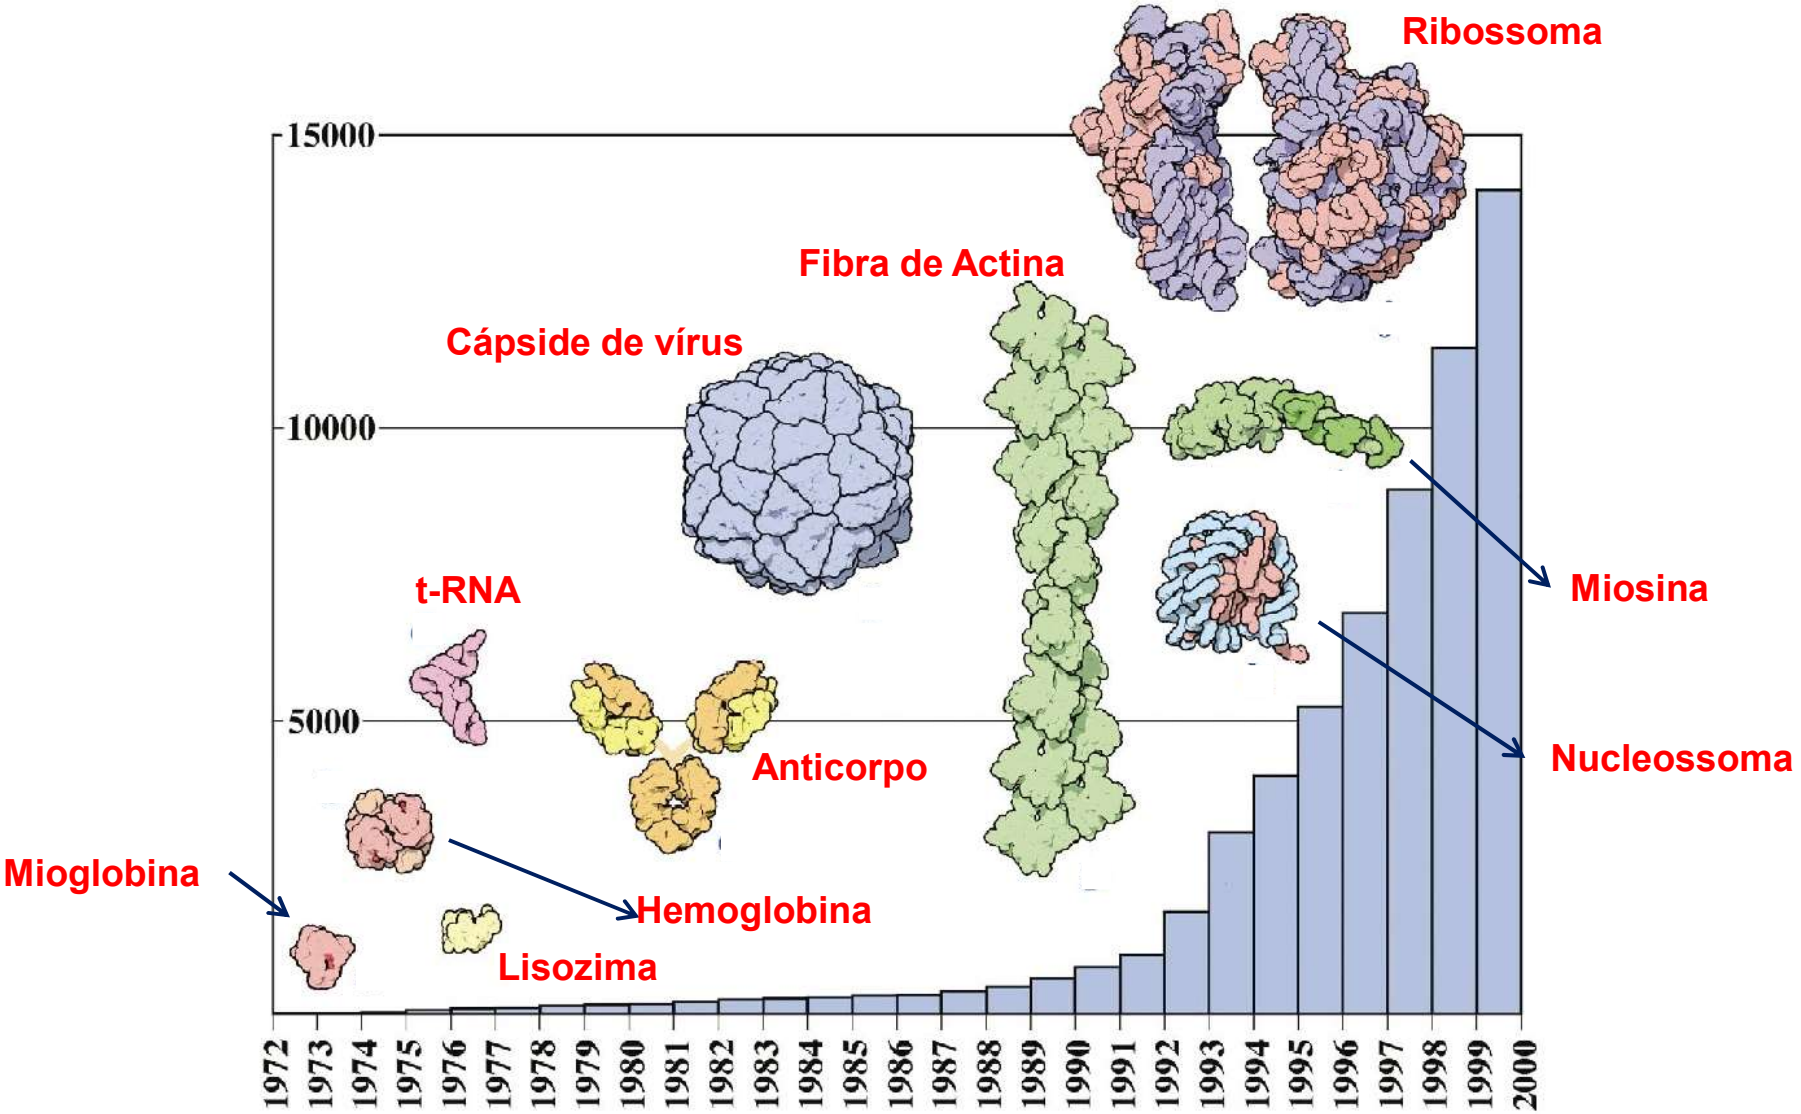


Deposição de estruturas no Protein Data Bank



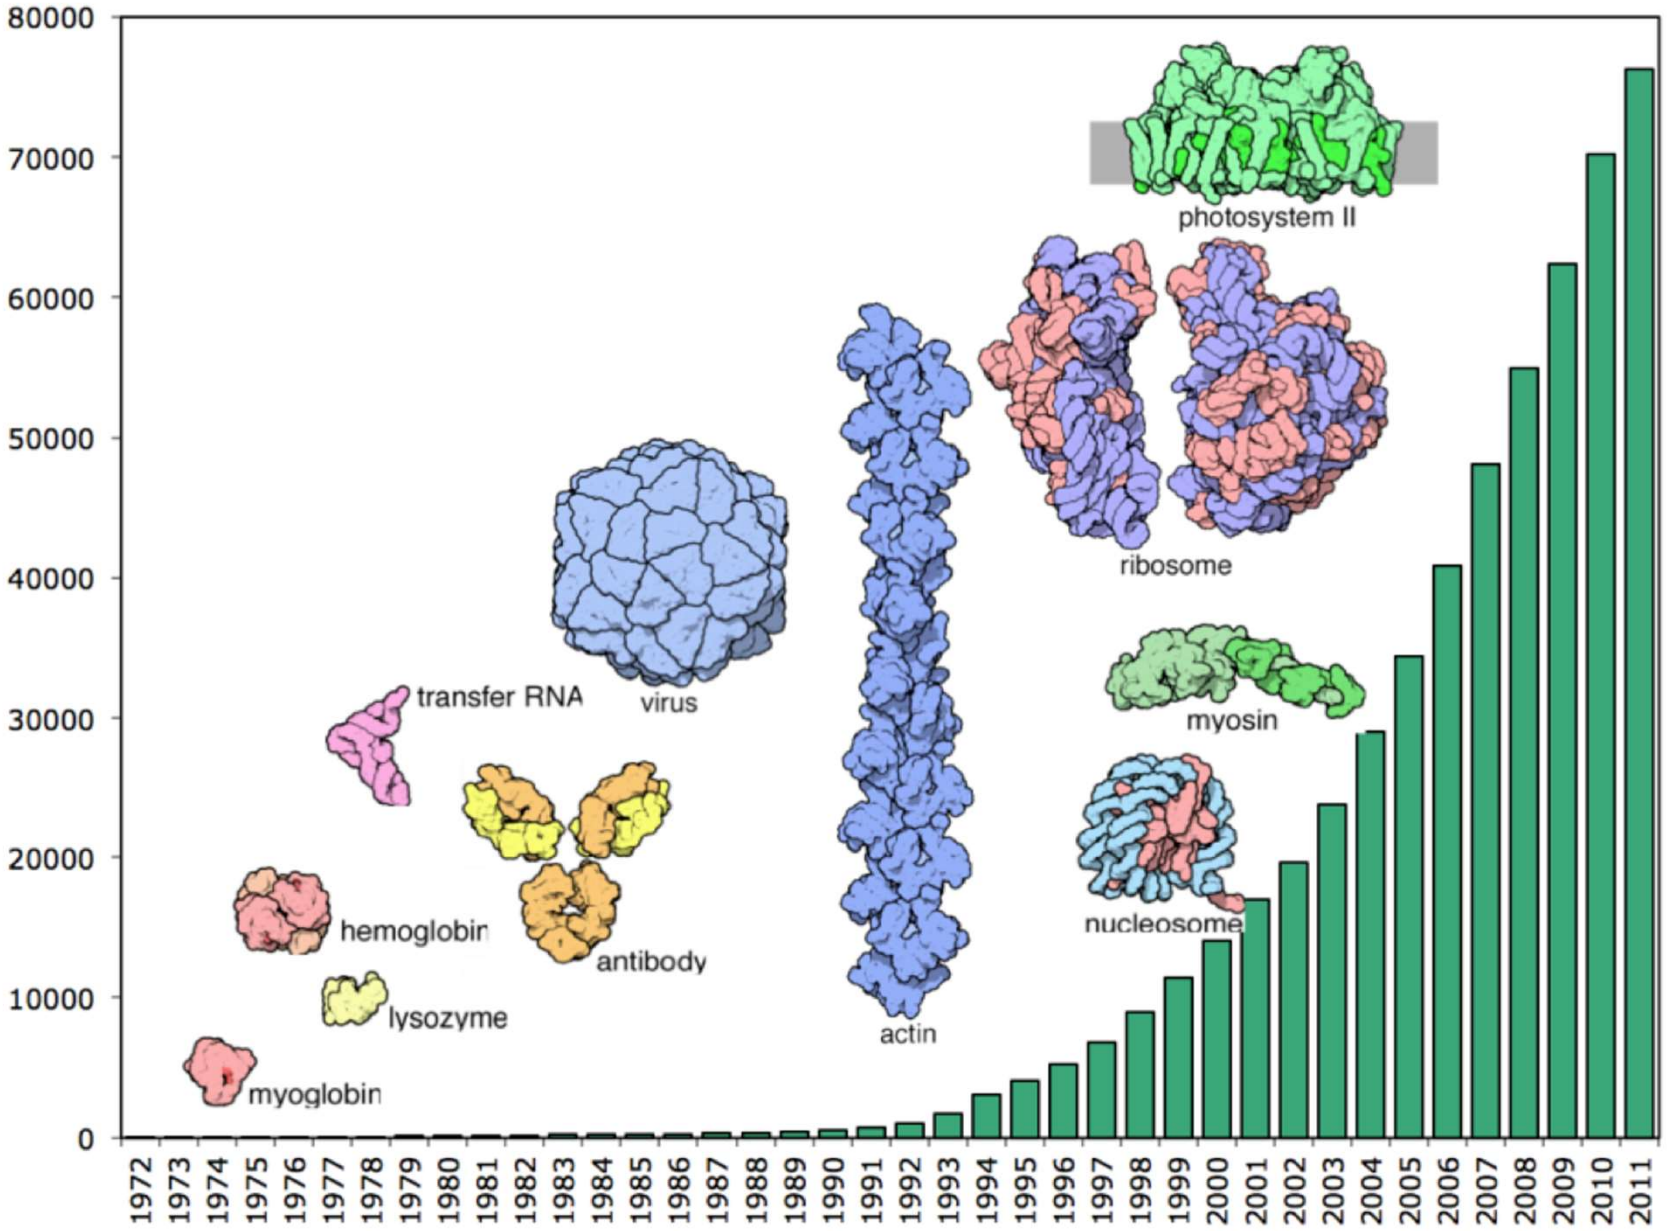
WORLDWIDE PDB
PROTEIN DATA BANK

Progresso na determinação das estruturas

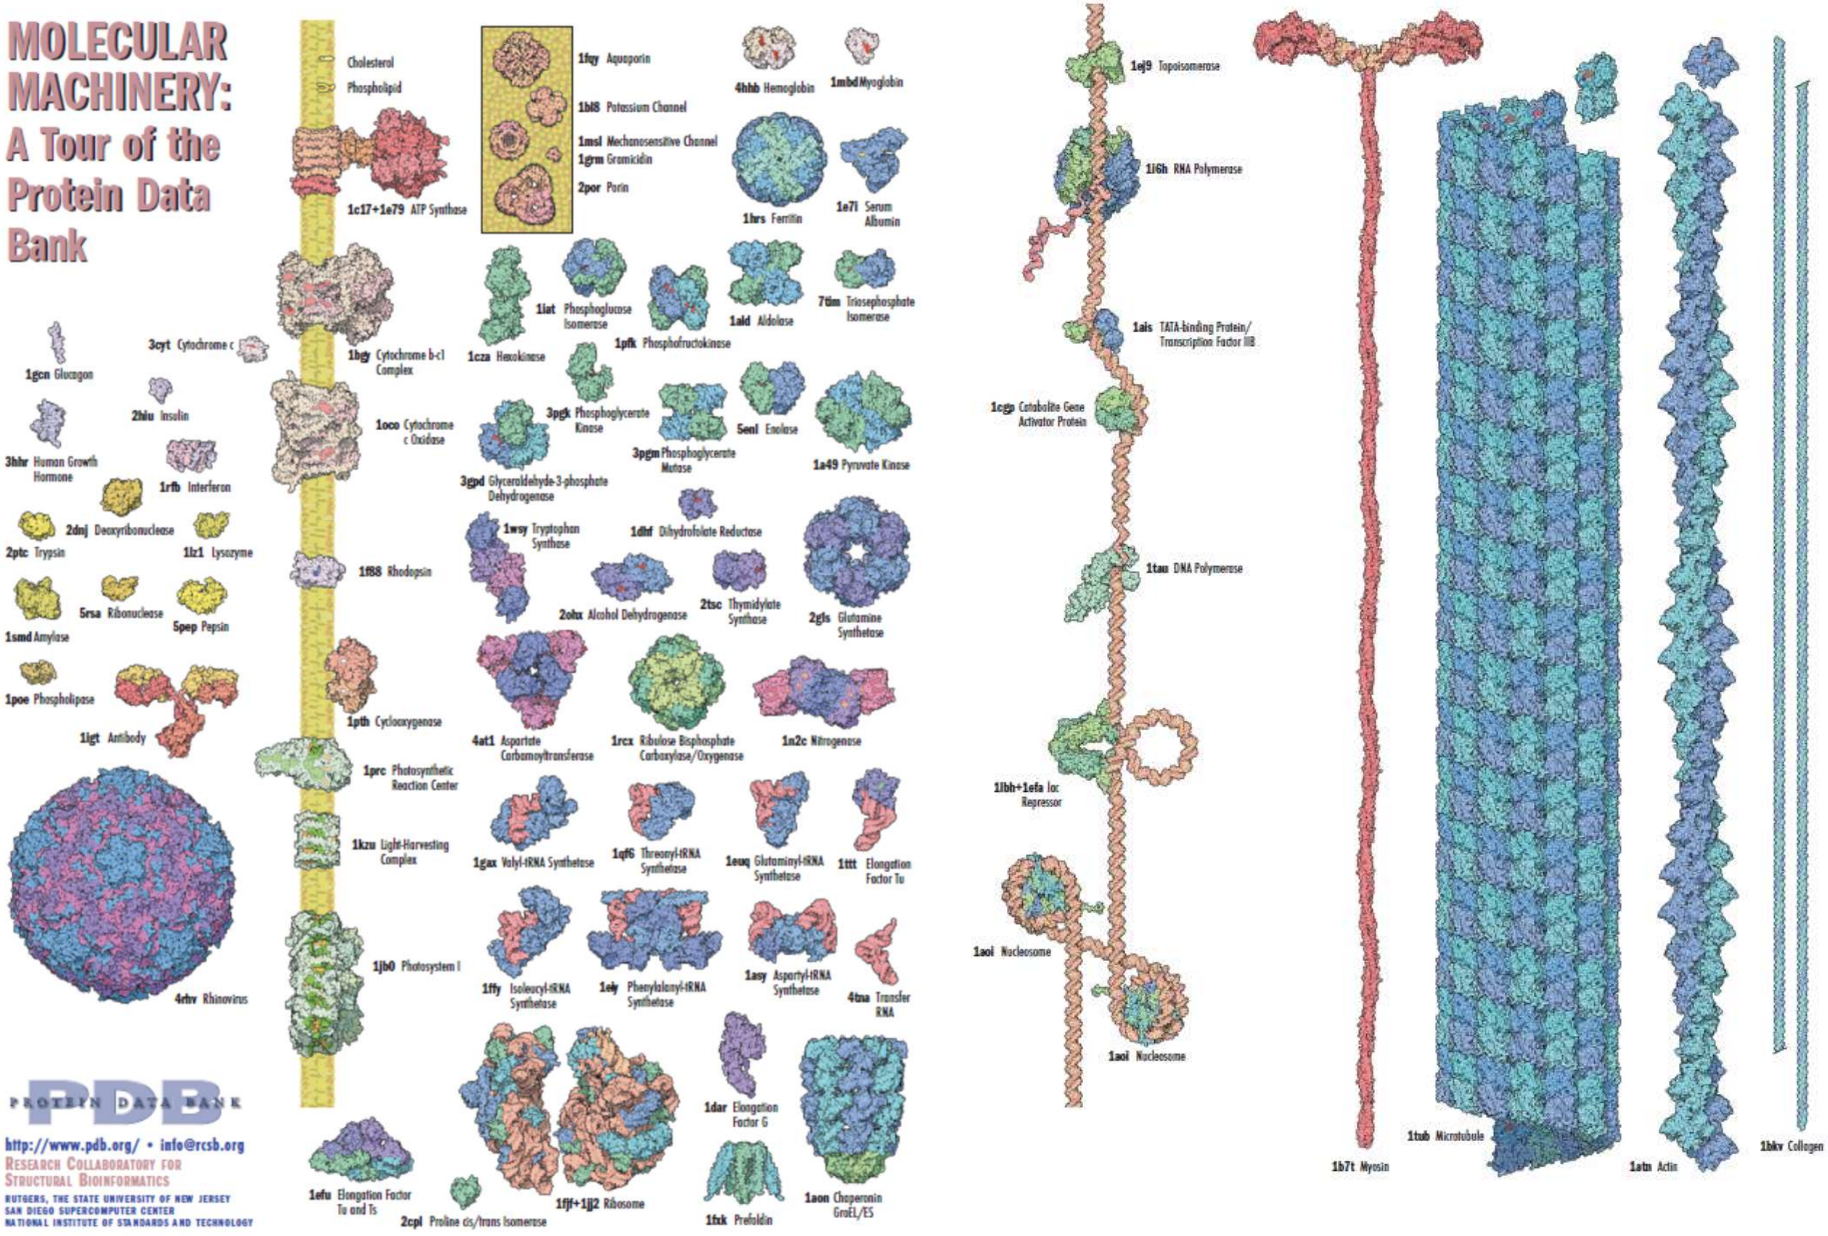


http://www.pdb.org

Progresso na determinação das estruturas



O PDB contém uma enorme diversidade estrutural!



Formatos de representação da estrutura

- A representação da estrutura molecular em bancos de dados passa pela descrição das **coordenadas atómicas**, do **tipo de átomo**, e das **ligações químicas** presentes.
- A descrição do tipo de átomos e ligações que os unem designa-se como **topologia** da molécula.
- No caso das proteínas, a topologia interna dos 20 aminoácidos standard pode ser assumida *a priori*, pois a estrutura dos aminoácidos é conhecida
- A topologia de outras moléculas, tais como grupos prostéticos , deverá ser especificada
- O formato "tradicional" de representação de estrutura no Protein Data Bank é o formato **PDB**.

Formato da informação no Protein Data Bank

• A informação contida no Protein Databank inclui coordenadas atómicas, topologias de ligação (descrição das ligações químicas), nomes dos átomos e grupos químicos, dados associados ao processo de determinação experimental da estruturas e outras informações sobre a função, ligandos, propriedades, etc…

• Presentemente a informação no PDB está disponível nos seguintes formatos:

  • **pdb file:** O formato "flat file", um tipo de ficheiro chamado "ficheiro PDB". Estes ficheiros são os mais utilizados pelos softwares de manipulação e visualização de estruturas e têm geralmente a extensão ".pdb"

  • **mmCIF:** - um formato mais poderoso e estruturado que o ficheiro PDB, ainda não tendo sido largamente adoptado

  • **XML:** - extended mark-up language, um formato muito geral de representação de informação, compatível com um vasto número de aplicações de software.

Formato do ficheiro PDB
